

CS401- Computer Architecture and Assembly Language Programming

Solution to Assignment # 1

Spring 2009

Total Marks: 20

Solution

Question_1:

What is the effective address generated by each of the following instruction?

Initially BX=0x0010, label=0x0124, [label]=0x0001, and SI=0x00F1

(Offsets in part a, b and f are in decimal)

- a. `mov ax, [bx+30]`
Effective Address = $bx + 30$
 = $0010 + 001E$
 = $002E$
- b. `mov ax, [bx+20]`
Effective Address = $bx + 20$
 = $0010 + 0014$
 = 0024
- c. `mov ax, [bx+label]`
Effective Address = $bx + label$
 = $0010 + 0124$
 = 0134
- d. `mov ax, [label+bx]`
Effective Address = $label + bx$
 = $0124 + 0010$
 = 0134
- e. `mov ax, [bx+si]`
Effective Address = $bx + si$
 = $0010 + 00F1$
 = 0101
- f. `mov ax, [si+15]`
Effective Address = $si + 15$
 = $00F1 + 000F$
 = 0100

Question_2:

Calculate the physical memory address generated by the following segment offset pairs (both are hexadecimal values).

- a. 0000:0100
16-bit Segment Address: 0000
16-bit Offset Address: 0100

Step1: Converting these to 20-bit addresses

20-bit Segment Address: 00000

20-bit Offset Address: 00100

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): $00000 + 00100 = 00100$

20-bit Physical address (in binary): 0000 0000 0001 0000 0000

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

b. 0010:0000

16-bit Segment Address: 0010

16-bit Offset Address: 0000

Step1: Converting these to 20-bit addresses

20-bit Segment Address: 00100

20-bit Offset Address: 00000

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): $00100 + 00000 = 00100$

20-bit Physical address (in binary): 0000 0000 0001 0000 0000

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

c. 1DAD:1234

16-bit Segment Address: 1DAD

16-bit Offset Address: 1234

Step1: Converting these to 20-bit addresses

20-bit Segment Address: 1DAD0

20-bit Offset Address: 01234

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): $1DAD0 + 01234 = 1ED04$

20-bit Physical address (in binary): 0001 1110 1101 0000 0100

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

d. 4321:FFFF

16-bit Segment Address: 4321

16-bit Offset Address: FFFF

Step1: Converting these to 20-bit addresses

20-bit Segment Address: 43210

20-bit Offset Address: 0FFFF

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): $43210 + 0FFFF = 5320F$

20-bit Physical address (in binary): 0101 0011 0010 0000 1111

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

e. FFFF:4321

16-bit Segment Address: FFFF

16-bit Offset Address: 4321

Step1: Converting these to 20-bit addresses

20-bit Segment Address: FFFF0

20-bit Offset Address: 04321

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): FFFF0 + 04321 = 104311 [As it is more than 20-bits, so wrap it around, that is, discard the most significant hexadecimal digit]

20-bit Physical address (in binary): 0000 0100 0011 0001 0001

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

f. FFEF:4421

16-bit Segment Address: FFEF

16-bit Offset Address: 4421

Step1: Converting these to 20-bit addresses

20-bit Segment Address: FFEF0

20-bit Offset Address: 04421

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): FFEF0 + 04421 = 104311 [As it is more than 20-bits, so wrap it around, that is, discard the most significant hexadecimal digit]

20-bit Physical address (in binary): 0000 0100 0011 0001 0001

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

g. 1080:0200

16-bit Segment Address: 1080

16-bit Offset Address: 0200

Step1: Converting these to 20-bit addresses

20-bit Segment Address: 10800

20-bit Offset Address: 00200

Step2: Performing hexadecimal addition:

20-bit Physical address (in hexadecimal): 10800 + 00200 = 10A00

20-bit Physical address (in binary): 0001 0000 1010 0000 0000

[Each hexadecimal digit can be represented in its 4-bit equivalent binary (as shown above)]

Question_3:

Ø Assembly language code:

;Program to add first five odd numbers without defining these numbers.

[ORG 0x100]

mov ax,0 ; initialize AX register with value 0

mov bx,1 ; initialize BX register with value 1

mov cx,5 ; We have to sum 5 numbers so initialize CX with value 5

```

Label: add ax,bx    ; add BX contents to AX
      add bx,2      ; add 2 to BX to make it next odd number
      sub cx,1      ; subtract 1 from CX
      jnz Label     ; Jump if not zero, that is, we have to add more
                    ; numbers

      mov ax, 0x4C00 ; terminate program
      int 0x21
    
```

- Ø Screen-shot displaying result in AX register (On AFD window, press the key combination Alt + PrintScreen to take screen-shot and paste it here)

1+3+5+7+9 = 25 (decimal) = 19 (hexadecimal)

```
