*****	WRITE BRIEF AND PRECISE ANSWERS. DO YOUR OWN WORK. DO NOT LOOK AROUND	*****
-------	---	-------

1. From consumption perspective, which type of network traffic results in costs to the consumer?

Ans: Outbound Traffic (Incoming is free)

2. How do tags help with Resource Management

Ans: Resource management Tags enable you to locate and act on resources that are associated with specific workloads, environments, business units, and owners.

3. What service in Azure can help you enforce the following organizational requirements:

- a. VMs should not be created with a public IP

Ans: Azure Policy

4. How can an administrator disallow modification of resources once they are properly configured?

Ans: Using Read Lock

5. What is the purpose of Azure Arc? What is the relationship between ARM and Arc? Name some of the resources that can be managed by Azure Arc?

Ans:

- a. Arc lets you extend your Azure compliance and monitoring to your hybrid and multi-cloud configurations
- b. Arc is managed using ARM
- c. Servers, SQL Server, Kubernetes, VMs

6. What is the purpose of azure advisor? Name any 3 categories related to cloud deployments which are targeted by Azure Advisor. Briefly mention the purpose of recommendation of that category.

Ans:

- a. Azure Advisor evaluates your Azure resources and makes recommendations based on best practices to help improve reliability, security, and performance, achieve operational excellence, and reduce costs.
- b. Cost, Reliability, Security, Performance, Operational Excellence (**Any 3**)
 - i. Reliability is used to ensure and improve the continuity of your business-critical applications.
 - ii. Security is used to detect threats and vulnerabilities that might lead to security breaches.
 - iii. Performance is used to improve the speed of your applications.
 - iv. Operational Excellence is used to help you achieve process and workflow efficiency, resource manageability, and deployment best practices.
 - v. Cost is used to optimize and reduce your overall Azure spending.

-------	---	-------

1. Which is the key monitoring platform in Azure? What is the role of Azure Log Analytics in this monitoring platform? Which functionality allows an administrator to be notified of any issue being detected?

Ans: a) Azure Monitor, b) Allows you to query data collected by Azure Monitor, c) Azure Monitor Alerts

2. Once the resources are configured, how can an administrator ensure that:
- They can be modified but not deleted
 - They cannot be modified

Ans: a) Delete Lock, b) Read Lock

3. What service in Azure can help you enforce the following organizational requirements:
- Storage accounts must have public access disabled

Ans: Azure Policy

4. How do tags help with Security.

Ans: Tags enable you to classify data by its security level, such as public or confidential.

5. How can an administrator get an alert when a spending limit is reached? What actions can be taken when a budget is reached?

Ans: a) Using Budget Alerts in Azure Cost Management, b) Modify, Suspend/Stop resources

6. Briefly explain Azure Arc? What is the relationship between ARM and Arc? Name some of the resources that can be managed by Azure Arc?

Ans:

- Arc lets you extend your Azure compliance and monitoring to your hybrid and multi-cloud configurations
- Arc is managed using ARM
- Servers, SQL Server, Kubernetes, VMs

- 1. What is the purpose of Azure Arc? What is the relationship between ARM and Arc? Name some of the resources that can be managed by Azure Arc?**

Ans:

- a. Arc lets you extend your Azure compliance and monitoring to your hybrid and multi-cloud configurations
- b. Arc is managed using ARM
- c. Servers, SQL Server, Kubernetes, VMs

- 2. Briefly explain the concept of Infrastructure as a Code. Mention 2 benefits of ARM Templates. What is the difference between bicep file and an ARM template?**

Ans:

a) Infrastructure as code (IaC) uses a descriptive model (based on json templates) to define and deploy infrastructure resources whether IaaS or PaaS.

b) **1)** Deploy, manage, and monitor all the resources for your solution as a group, rather than handling these resources individually. **2)** Apply tags to resources to logically organize all the resources in your subscription. **3)** Define the dependencies between resources, so they're deployed in the correct order. **4)** Re-deploy your solution throughout the development life-cycle and have confidence your resources are deployed in a consistent state.

c) Bicep files tend to use a simpler, more concise style. ARM layer accept Bicep file to deploy resources.

- 3. How can an administrator disallow modification of resources once they are properly configured?**

Ans: Read Lock

- 4. How can an administrator disallow deletion of resources while allowing any updates?**

Ans: Delete lock

- 5. What service in Azure can help you enforce the following organizational requirements:**

- a. VMs should not be created with a public IP

Ans: Azure Policy

- 6. How do tags help with Cost Management**

Ans: Tags enable you to group resources so that you can report on costs, allocate internal cost centers, track budgets, and forecast estimated cost.
